

# Defining Your Research Problem

| Stakeholder                                         | Description                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Focal Stakeholder</b>                            | <b>Cebu Premiere Real Estate (CPRE)</b> is a property development and brokerage company in Cebu that handles property listings, pricing, and sales.                                                                                                                                                                                                 |
| <b>Context (What's happening?)</b>                  | The real estate market in Cebu is growing fast because of more infrastructure projects and a strong demand for houses, condos, and commercial spaces. But when it comes to property pricing, there's still no standard method. Many appraisals rely on personal judgment or old zonal values. This makes pricing inconsistent and sometimes unfair. |
| <b>Expectation (Ideal Scenario)</b>                 | CPRE wants to have a more accurate and transparent way of pricing its properties. Ideally, property prices should be based on real data — like floor area, lot size, location, and distance from landmarks — so that valuations are consistent and fair. This would make their pricing more reliable and build trust with clients.                  |
| <b>Reality (Current Situation)</b>                  | Right now, CPRE depends mostly on manual appraisals and comparisons with nearby properties. There's no centralized data source or tool that helps predict property prices. Because of this, prices can vary a lot even for similar properties, which sometimes slows down sales and confuses clients.                                               |
| <b>Decision Problem</b>                             | How can Cebu Premiere Real Estate use a data-driven model that predicts property values based on measurable features to make its pricing more accurate and consistent?                                                                                                                                                                              |
| <b>Research Problem (The Gap)</b>                   | There's a lack of studies and local applications that use predictive analytics for real estate pricing in Cebu. Most property valuations are still done manually and depend on experience, not on actual data. This results in inconsistencies between appraisers and across similar listings.                                                      |
| <b>Significance of the Problem (Why it matters)</b> | Building a data-driven pricing model will help CPRE make fairer and more consistent property valuations. It can help clients understand prices better and speed up sales. In the bigger picture, it can also make Cebu's real estate market more transparent and data-based, benefiting developers, banks, and buyers.                              |
